

2. SYSTEM DESIGN

2.1 Introduction

- System design is the process of defining the architecture, module interfaces and data for a system to satisfy the specified requirements.
- The purpose of the design phase is to plan the solution of the problem specified by the requirement documents.
- This is the first step that moving from problem domain to the solution domain.
- The design of the system is essentially a blueprint or a plan for a solution for the system.

2.2 Functional decomposition

Functional decomposition is the process of taking a complex process and breaking it down into its smaller, simpler parts. Using Functional decomposition larger or complex functionalities are more easily understood. It is mainly used during project analysis phase, so each phase can be viewed as software. So, this has modular with some sub modules.

2.3 Context Flow Diagram (CFD) :

2.4 Data Flow Diagram (DFDs Level 0, Level 1, Level 2) :

Symbols	Name	Description
	Process	It performs transformation of data from one state to another.
	Source /Sink	It represents the external entity that may be either source or Sink.
	Flow of data	It represents the flow of data from source to destination
	Data Source/Data storage	It is the place where data is stored.
